**Oil Panic and the Global Crisis** Jun 27 2019 Is the world running out of oil? This book analyzes predictions of global oil depletion in the context of science, history, and economics. There has been continuing alarm about the imminent exhaustion of earth's non-renewable resources. Yet, the world has never run out of any significant, globally traded, non-renewable resource. Is the world finally facing a non-renewable resource depletion catastrophe, or is the current concern just another one of a succession of panics? In this book, key assumptions and underlying arguments in the global oil-depletion debate are first summarized and then challenged. Facts about oil supply, production, and consumption are made accessible using concise and simple graphics. Concepts of resource depletion, end-use needs, technology leap-frogging, efficiency, and substitution are used to evaluate historical patterns of exploitation of non-renewable resources and to explore what history suggests about our future dependence on oil. This book is aimed at a broad range of readers, from undergraduate students studying resource science and economics to anyone interested in understanding the context of the controversy over global oil depletion. "It is a book serious students of the world oil market should read, not because Gorelick has all the answers but because his account is well reasoned, well informed, and argued honestly, with respect for responsible opposing viewpoints." Book Review, Science, May 2010

*Cost, Effectiveness, and Deployment of Fuel Economy Technologies for Light-Duty Vehicles* Nov 05 2022 The light-duty vehicle fleet is expected to undergo substantial technological changes over the next several decades. New powertrain designs, alternative fuels, advanced materials and significant changes to the vehicle body are being driven by increasingly stringent fuel economy and greenhouse gas emission standards. By the end of the next decade, cars and light-duty trucks will be more fuel efficient, weigh less, emit less air pollutants, have more safety features, and will be more expensive to purchase relative to current vehicles. Though the gasoline-powered spark ignition engine will continue to be the dominant powertrain configuration even through 2030, such vehicles will be equipped with advanced technologies, materials, electronics and controls, and aerodynamics. And by 2030, the deployment of alternative methods to propel and fuel vehicles and alternative modes of transportation, including autonomous vehicles, will be well underway. What are these new technologies - how will they work, and will some technologies be more effective than others? Written to inform The United States Department of Transportation's National Highway Traffic Safety Administration (NHTSA) and Environmental Protection Agency (EPA) Corporate Average Fuel Economy (CAFE) and greenhouse gas (GHG) emission standards, this new report from the National Research Council is a technical evaluation of costs, benefits, and implementation issues of fuel reduction technologies for next-generation light-duty vehicles. *Cost, Effectiveness, and Deployment of Fuel Economy Technologies for Light-Duty Vehicles* estimates the cost, potential efficiency improvements, and barriers to commercial deployment of technologies that might be employed from 2020 to 2030. This report describes these promising technologies and makes recommendations for their inclusion on the list of technologies applicable for the 2017-2025 CAFE standards.
