*The Future of Computing Performance* Apr 04 2020 The end of dramatic exponential growth in single-processor performance marks the end of the dominance of the single microprocessor in computing. The era of sequential computing must give way to a new era in which parallelism is at the forefront. Although important scientific and engineering challenges lie ahead, this is an opportune time for innovation in programming systems and computing architectures. We have already begun to see diversity in computer designs to optimize for such considerations as power and throughput. The next generation of discoveries is likely to require advances at both the hardware and software levels of computing systems. There is no guarantee that we can make parallel computing as common and easy to use as yesterday's sequential single-processor computer systems, but unless we aggressively pursue efforts suggested by the recommendations in this book, it will be "game over" for growth in computing performance. If parallel programming and related software efforts fail to become widespread, the development of exciting new applications that drive the computer industry will stall; if such innovation stalls, many other parts of the economy will follow suit. The Future of Computing Performance describes the factors that have led to the future limitations on growth for single processors that are based on complementary metal oxide semiconductor (CMOS) technology. It explores challenges inherent in parallel computing and architecture, including ever-increasing power consumption and the escalated requirements for heat dissipation. The book delineates a research, practice, and education agenda to help overcome these challenges. The Future of Computing Performance will guide researchers, manufacturers, and information technology professionals in the right direction for sustainable growth in computer performance, so that we may all enjoy the next level of benefits to society.

*Acrobatic Modernism from the Avant-Garde to Prehistory* Aug 09 2020 This is a book about artistic modernism contending with the historical transfigurations of modernity. As a conscientious engagement with modernity's restructuring of the lifeworld, the modernist avant-garde raised the stakes of this engagement to programmatic explicitness. But even beyond the vanguard, the global phenomenon of jazz combined somatic assault with sensory tutelage. Jazz, like the new technologies of modernity, re-calibrated sensory ratios. The criterion of the new as self-making also extended to names: pseudonyms and heteronyms. The protocols of modernism solicited a pragmatic arousal of bodily sensation as artistic resource, validating an acrobatic sensibility ranging from slapstick and laughter to the pathos of bereavement. Expressivity trumped representation. The artwork was a diagram of perception, not a mimetic rendering. For artists, the historical pressures of altered perception provoked new models, and Ezra Pound's slogan 'Make It New' became the generic rallying cry of renovation. The paradigmatic stance of the avant-garde was established by Futurism, but the discovery of prehistoric art added another provocation to artists. Paleolithic caves validated the spirit of all-over composition, unframed and dynamic. Geometric abstraction, Constructivism and Purism, and Surrealism were all in quest of a new mythology. Making it new yielded a new pathos in the sensation of radical discrepancy between futurist striving and remotest antiquity. The Paleolithic cave and the USSR emitted comparable siren calls on behalf of the remote past and the desired future. As such, the present was suffused with the pathos of being neither, but subject to both.

**A Graphical Approach to Algebra and Trigonometry** May 18 2021 This is the eBook of the printed book and may not include any media, website access codes, or print supplements that may come packaged with the bound book. A Graphical Approach to Algebra and Trigonometry illustrates how the graph of a function can be used to support the solutions of equations and inequalities involving the function. Beginning with linear functions in Chapter 1, the text uses a four-part process to analyze each type of function, starting first with the graph of the function, then the equation, the associated inequality of that equation, and ending with applications. The text covers all of the topics typically caught in a college algebra course, but with an organization that fosters students' understanding of the interrelationships among graphs, equations, and inequalities. With the Fifth Edition, the text continues to evolve as it addresses the changing needs of today's students. Included are additional components to build skills, address critical thinking, solve applications, and apply technology to support traditional algebraic solutions, while maintaining its unique table of contents and functions-based approach. A Graphical Approach to Algebra and Trigonometry continues to incorporate an open design, with helpful features and careful explanations of topics.

**Discovering Psychology: The Science of Mind** Aug 21 2021 In this fresh new offering to the Intro Psychology course, authors John Cacioppo and Laura Freberg portray psychology as being an integrative science in two ways. First, they have written a text that reflects psychology's rightful place as a hub science that draws from and is cited by research in many other fields. Second, this text presents psychology as a unified science that seeks a complete understanding of the human mind, rather than as a loosely organized set of autonomous subspecialties. As psychology moves rapidly toward maturity as an integrative, multidisciplinary field, the introductory course offers an opportunity to teach all of psychology in one place and at one time. This text reflects that evolution--and the authors' excitement about it. **Laszlo Moholy-Nagy** Mar 04 2020 Marking the centenary of the birth of Laszlo Moholy-Nagy (1895–1946), this book offers a new approach to the Bauhaus artist and theorist's multifaceted life and work—an approach that redefines the very idea of biographical writing. In Laszlo Moholy-Nagy, Louis Kaplan applies the Derridean deconstructivist model of the "signature effect" to an intellectual biography of a Constructivist artist. Inhabiting the borderline between life and work, the book demonstrates how the signature inscribed by "Moholy" operates in a double space, interweaving signified object and signifying matter, autobiography and auto-graphy. Through interpretative readings of over twenty key artistic and photographic works, Kaplan graphically illustrates Moholy's signature effect in action. He shows how this effect plays itself out in the complex of relations between artistic originality and plagiarism, between authorial identity and anonymity, as well as in the problematic status of the work of art in the age of technical reproduction. In this way, the book reveals how Moholy's artistic practice anticipates many of the issues of postmodernist debate and thus has particular relevance today. Consequently, Kaplan clarifies the relationship between avant-garde Constructivism and contemporary deconstruction. This new and innovative configuration of biography catalyzed by the life writing of Moholy-Nagy will be of critical interest to artists and writers, literary theorists, and art historians.
