PID Control Jan 30 2020 The effectiveness of proportional-integral-derivative (PID) controllers for a large class of process systems has ensured their continued and widespread use in industry. Similarly there has been a continued

interest from academia in devising new ways of approaching the PID tuning problem. To the industrial engineer and many control academics this work has previously appeared fragmented; but a key determinant of this literature is the type of process model information used in the PID tuning methods. PID Control presents a set of coordinated contributions illustrating methods, old and new, that cover the range of process model assumptions systematically. After a review of PID technology, these contributions begin with model-free methods, progress through non-parametric model methods (relay experiment and phase-locked-loop procedures), visit fuzzy-logic- and genetic-algorithm-based methods; introduce a novel subspace identification method before closing with an interesting set of parametric model techniques including a chapter on predictive PID controllers. Highlights of PID Control include: an introduction to PID control technology features and typical industrial implementations; chapter contributions ordered by the increasing quality of the model information used; novel PID control concepts for multivariable processes. PID Control will be useful to industry-based engineers wanting a better understanding of what is involved in the steps to a new generation of PID controller techniques. Academics wishing to have a broader perspective of PID control research and development will find useful pedagogical material and research ideas in this text.

Russian Cyber Operations Dec 31 2019 Russia has deployed cyber operations to interfere in foreign elections, launch disinformation campaigns, and cripple neighboring states—all while maintaining a thin veneer of deniability and avoiding strikes that cross the line into acts of war. How should a targeted nation respond? In Russian Cyber Operations, Scott Jasper dives into the legal and technical maneuvers of Russian cyber strategies, proposing that nations develop solutions for resilience to withstand future attacks. Jasper examines the place of cyber operations within Russia's asymmetric arsenal and its use of hybrid and information warfare, considering examples from recent French and US presidential elections and the 2017 NotPetya mock ransomware attack, among others. Jasper shows the international effort to counter these operations through sanctions and indictments has done little to alter Moscow's behavior and instead proposes that nations use data correlation technologies in an integrated security platform to establish a more resilient defense. Russian Cyber Operations provides a critical framework for determining whether Russian cyber campaigns and incidents rise to the level of armed conflict or operate at a lower level as a component of competition. Jasper's work offers the national security community a robust plan of action critical to effectively mounting a durable defense against Russian cyber campaigns.

Advances in Understanding Human Performance Mar 02 2020 Combining emerging concepts, theories, and applications of human factors knowledge, this volume focuses on discovery and understanding of human performance issues in complex systems, including recent advances in neural basis of human behavior at work (i.e. neuroergonomics), training, and universal design. The book is organized into ten sections that focus on the following subject matters: I: Neuroergonomics: Workload Assessment II: Models and Measurement in Neuroergonomics III: Neuroergonomics and Human Performance IV: Neuroergonomics and Training Issues V: Trainees: Designing for Those in Training VI: Military Human Factors: Designing for Those in the Armed Forces VII: New Programs/New Places: Designing for Those Unfamiliar with Human Factors VIII: Universal Design: Designing to Include Everyone IX: Designing for People with Disabilities X: Children and Elderly: Designing for Those of Different Ages Sections I through IV of this book focus on neuroscience of human performance in complex systems, with emphasis on the assessment and modeling of cognitive workload, fatigue, and training effectiveness. Sections V through X concentrate on applying human factors to special populations, with the caveat that the design information may not generalize to (or be of interest to) other populations. This broadens the conventional definition which limits special populations to those who have limitations in their functional abilities, i.e. those with chronic disabilities due to illness, injury, or aging. Thus, special populations can incorporate certain investigations and designs focused on military, students, or even developing countries and those naïve to the field of

human factors, as well as those who are affected by disabilities and aging (both young and old). Many chapters of this book focus on analysis, design, and evaluation of challenges affecting students, trainees, members of the military, persons with disabilities, and universal design. In general, the chapters are organized to move from a more general, to a more specialized application. For example, the subtopics for those with disabilities include designing websites, workstations, housing, entrepreneur training, communication strategies, products, environments, public transportation systems, and communities. This book is of special value to a large variety of professionals, researchers and students in the broad field of human performance who are interested in neuroergonomics, training effectiveness, and universal design and operation of products and processes, as well as management of work systems in contemporary society. We hope this book is informative, but even more - that it is thought provoking. We hope it inspires, leading the reader to contemplate other questions, applications, and potential solutions in creating designs that improve function, efficiency, and ease-of-use for all. Seven other titles in the Advances in Human Factors and Ergonomics Series are: Advances in Human Factors and Ergonomics in Healthcare Advances in Applied Digital Human Modeling Advances in Cross-Cultural Decision Making Advances in Cognitive Ergonomics Advances in Occupational, Social and Organizational Ergonomics Advances in Human Factors, Ergonomics and Safety in Manufacturing and Service Industries Advances in Ergonomics Modeling & Usability Evaluation
